

Electronic Logbook

A Microsoft Excel-based pilot logbook with automatic update delivery via GitHub. Designed for Australian general aviation, it supports single-engine and multi-engine operations, instrument currency tracking, approach logging, and route mapping.

Download: For normal use, download the latest `Electronic_Logbook_Master.xlsm` from the repository's GitHub Releases page rather than cloning the repository.

Changelog

[1.2.0] - 2026-06-01

- Prepared the project for public repository release
- Added public security, contribution, and licensing information
- Added release checks to prevent publishing workbooks with private update tokens

[1.1.2] - 2026-05-30

- Fixed some Recency items that were calculating incorrectly
- Added currency/recency tracking for OPCs

[1.1.1] - 2026-05-25

- Fixed incorrect airports showing in route history

[1.1.0] - 2026-05-23

- New entries are now sorted into date order automatically
- Route map data is now kept during updates where possible
- The logbook will ask to rebuild route map data when it needs refreshing
- Improved the Hours by Year chart after adding entries or updating
- If date reset is set to "today", the New Entry date now resets when the file opens
- The "next day" date reset now moves to the day after the entry you just added

[1.0.10] - 2026-05-18

- Added Warning for Excel Trust Center not being enabled
- Added option to Reset day to one day after the last entry, on completion of export

[1.0.9] - 2026-05-11

- Rearranged New Entry page, for better readability and usage of space

[1.0.8] - 2026-04-30

- Ensured updated files would save inside the current folder, rather than in My Documents
- Added more diagnostic logs for crashes and errors
- Fixed issue where update process could download old/cached version

[1.0.7] - 2026-04-26

- Added ability to choose whether Date resets to Today, or remains as-is, after Export
- Added button to Suppress All Warnings for 24 hours
- Added Debug Logs in the event of an excel crash

[1.0.6] - 2026-04-16

- Added PDF Readme
- Ensured table formatting would stay the same after update
- Ensured most recent version of update process would always be used

[1.0.5] - 2026-04-15

- Back-end fixes
- Reformatted Admin page, added reminders to not modify values

[1.0.4] - 2026-04-14

- Fixed issue where macros would break on original copy of spreadsheet after update

[1.0.3] - 2026-04-14

- Added 'Help' page with Readme access to Spreadsheet

[1.0.2] - 2026-04-14

- Formatted Custom Logbook Entries
- Ensured most up-to-date process followed for updating Logbook

[1.0.1] - 2026-04-14

- Added automatic update access handling

[1.0.0] - 2026-04-13

Initial release.

Features

- Structured flight data entry with hard and soft validation
 - Automatic currency and recency calculations (passenger carrying, IFR, NVFR, OPC)
 - Cumulative and statistical analysis across the full logbook
 - Charts: hours by year, hours by type, hours by registration, hours over time
 - Airport visit tracking with visit counts and base flagging
 - Route map export compatible with kepler.gl
 - Route map rebuild prompts only when needed
 - Automatic update system -- when a new version is published, users are prompted to update on next open
-

Requirements

- Microsoft Excel for Windows (2016 or later recommended)
 - Macros must be enabled
 - For automatic updates: internet access on the machine running the logbook
-

Getting Started

1. Download the logbook

Download `Electronic_Logbook_Master.xlsm` from the latest GitHub Release. This is your personal copy -- rename it if you wish (e.g. `Electronic_Logbook_YourName.xlsm`).

Note: You will receive a 'Build Routes Table' dialog when you open it. Press 'Yes'. You only need to do this the first time, or when a future update needs to refresh route map data.

2. Enable macros

When you first open the file, Excel will display a security warning at the top of the screen:

"SECURITY WARNING: Macros have been disabled."

Click **Enable Content**. The logbook will not function correctly without macros enabled.

3. Enable Trust Access to the VBA Project

This setting ensures the logbook can automatically update its own VBA code when a new version is released. Without it, formula and sheet updates will still be applied, but VBA module updates will not.

To enable:

1. Go to **File -> Options -> Trust Center -> Trust Center Settings**
1. Select **Macro Settings**

1. Check "**Trust access to the VBA project object model**"

1. Click OK

This is a one-time setting per machine.

Only enable macros and VBA project access for workbooks downloaded from this repository's GitHub Releases page. Do not run modified copies from untrusted sources.

4. First open -- build the Routes table

On first open, you will be prompted to build the Routes table. This scans your logbook entries and constructs a table of all departure/arrival pairs, which is used for the route map export. Click **Yes** when prompted. This may take a few seconds depending on the size of your logbook.

This prompt will not appear again after the initial build unless a later update needs to refresh route map data. Routes are updated automatically each time a new logbook entry is added.

Starting a New Logbook

1. Download `Electronic_Logbook_Master.xlsm` from this repository

1. Rename it to something personal (e.g. `Electronic_Logbook_YourName.xlsm`)

1. Open the file and enable macros when prompted

1. On first open, click **Yes** when prompted to build the Routes table (it will be empty at this stage, which is fine -- it will populate as you add entries)

1. Navigate to the **New Entry** sheet and begin entering your flights

Note: The logbook contains two placeholder entries by default. Do not delete these until you have added at least two of your own entries, as they are required to maintain the correct table and formula structure.

Adding a Logbook Entry

Always add entries using the **New Entry** sheet -- do not attempt to add rows manually to the Logbook table. Manual row insertion will bypass validation and may break formulas and table structure.

1. Navigate to the **New Entry** sheet

1. Fill in the date, aircraft details, crew, and flight time fields

1. Click **Add to Logbook**

After an entry is added, the Logbook table is automatically sorted by Date. Depending on your date reset setting, the New Entry date can reset to today or to the day after the entry you just added.

Entering `OPC` in the Details field triggers the `Logbook[OPC]` helper column. This feeds the 61.870 3-month recency exemption and 61.880 proficiency validity logic. Only use `OPC` for a qualifying operator proficiency check that covered IFR operations.

The entry form includes validation that will warn you of potential errors before saving, including:

- Invalid or future dates
- Zero total hours
- Landings recorded without corresponding hours (and vice versa)

- Approaches recorded without instrument hours
- IFR hours exceeding total hours
- OPC recorded without instrument hours or approaches
- Potential duplicate entries

Some checks will prevent saving (hard errors), while others prompt you to confirm before continuing (warnings).

Modifying Existing Entries

You can edit existing entries directly in the **Logbook** sheet. The following rules apply:

- **Do not edit the Date column.** The Date column is calculated automatically and is read-only. To change a date, edit the **Year**, **Month**, and **Day** columns instead.
- All other data columns (Type, Reg, PIC, hours, landings, approaches etc.) can be edited directly.

Deleting Entries

To delete one or more logbook entries:

1. In the **Logbook** sheet, click the row number(s) on the left to select the entire row(s)
1. Right-click and select **Delete**

Important: Do not delete the placeholder entries until you have added at least two of your own entries. The placeholder rows are required to maintain the correct table and formula structure during the initial setup period.

Creating Custom Columns

There are 4 preset custom columns in the Logbook

Custom Entries			
Custom 1	Custom 2	Custom 3	Custom 4

Simply edit the Headers in the Logbook table to your desired category. For example:

Custom Entries			
Dual XC	Solo XC	Turbine	PJE Sorties

Updating the Logbook

When a new version is available, you will see a prompt when opening the file:

"A new version of the Electronic Logbook is available!"

Click **Yes** to update. The update process will:

1. Download the latest master file from GitHub
1. Inject your existing flight data into the new version
1. Rebuild all charts and pivot tables
1. Rename your previous file to `[YourFilename]_Old.xlsm`
1. Save the updated logbook using your original filename

Once the update is complete, close the `_Old` file and reopen your logbook from the original filename.

Note: If your file is stored in a OneDrive folder that is synced via a cloud URL, the old and updated files may be saved to your Documents folder instead, under `Electronic Logbook\`. You can move them back to your OneDrive folder afterwards.

What is preserved during an update

The following data is carried across from your existing logbook to the updated version:

Data	Preserved
All flight log entries (Year through Circling)	Yes
All other logbook columns (formulas, cumulative totals)	Rebuilt from master
Airport list	Rebuilt from master
Routes table	Preserved where possible; you will be prompted if it needs to be rebuilt

Charts and pivot tables	Rebuilt from master
VBA code	Updated from master

Manual update check

You can check for updates at any time by running the `CheckForUpdateManual` macro from the Developer tab or by wiring it to a button on any sheet.

Troubleshooting

Macros are disabled and I cannot enable them

If you downloaded the file from the internet, Windows may have blocked it. Right-click the file in Explorer, select **Properties**, and check "**Unblock**" at the bottom of the General tab. Then re-open the file.

My charts look wrong or are not displaying data correctly

Press **Ctrl+Alt+F5** to refresh all data connections and pivot tables. This will force all charts to recalculate from the current logbook data.

The update prompt appears but the update fails

Check that you have an active internet connection. If the problem persists, note the error step and error number shown in the failure dialog and raise an issue on this repository.

The Routes table is empty after an update

You will be prompted to rebuild it on first open of the updated file. If you accidentally dismissed the prompt, you can rebuild manually by running the `RebuildRoutesTableNow` macro from the Developer tab.

Route map export says routes may be out of date

This appears when your route map data may need refreshing. Choose **Yes** to rebuild the Routes table before exporting.

The HoursByYear chart is not grouped correctly after an update

Open the **ChartData** sheet, locate the **HoursByYear** pivot table, and:

1. Remove **Date** from the Rows field
1. Press **Ctrl+Alt+F5** to refresh all
1. Re-add **Date** to the Rows field

Currency calculations seem incorrect

Check that the **Currency + Recency** sheet is not using an overridden date. There is a manual override field for the IPC/IFR date -- if this has been set, clear it to return to automatic calculation.

File Structure

File	Purpose
Electronic_Logbook_Master.xlsm	Master template -- distributed to users and used as the update source
modBoot.bas	Bootstrap module that refreshes the updater code
modUpdate.bas	VBA module for the auto-update system
version.txt	Current version number -- checked on workbook open
README.md	This file
